## **AMERICAN EEL**

(06/00 ARCHIVE - NCDMF)

**Stock Status** -- *Unknown* - The current status of the American eel stock is poorly understood. This is due to limited and non-uniform stock assessment efforts and protocols across the range of this species.

**Average Commercial Landings and Value 1989-1999 –** 91,139; \$172,524

1999 Commercial Landings and Value -- 99,904 lbs.; \$134,038

Average Recreational Landings 1989-1999 -- Unknown 1999 -- Unknown

Status of Fisheries Management Plan -- ASMFC FMP 2000

Research and Data Needs - All areas.

**Current Minimum Size limit/Creel limit** – 6 inch total length (TL) for recreational and commercial fisheries. A possession limit of 50 eels for recreational fishermen. (Temporary rule to comply with ASMFC FMP)

Harvest Season -- Entire year

Size and Age at Maturity – Males 12 inches at age 4-8, Females 18 inches at age 7-12

Historical and Current Maximum Age -- 85 years old

**Juvenile Abundance Index Average 1989-1999** – N/A **1999** – N/A Annual Young-of-Year Abundance Survey to be initiated in 2000.

Habits/Habitats – Catadromous species requiring multiple habitats including ocean, estuaries, and fresh water streams and rivers. Catadromous life cycle, migrating back to spawn in the ocean (Sargasso Sea) in the winter and early spring and spending the majority of its life in brackish and freshwater. Larvae (leptocephali) develop at sea and change from glass eels into young (elvers) in nearshore oceanic waters and estuaries. Around age 2 the juvenile or yellow eel stage resembles the adult form. They inhabitat estuaries, rivers, streams, and lakes and feed on invertebrates and smaller fish. Prefer areas with soft bottom and vegetation to hide in. The mature silver eel life state occurs at the time of downstream migration, leaving the estuary for the open ocean to spawn then die. Seaward migration occurs in late summer and fall.
